Comp. Biochem. Physiol. 118B:181-187(1997).

-i. FUNCTION: ACTS UPON ELASTIN.

-i. CATALYTIC ACTIVITY: Preferential cleavage: Leu-|-Xaa, Met-|-Xaa and Phe-|-Xaa. Hydrolyzes elastin.

-i. SUBCELLULAR LOCATION: Secreted.

-i. TISSUE SPECIFICITY: PANCREAS.

-i. SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. ELASTASE SUBFAMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

and is derived by analysis of the total score distribution.

C;Comment: Tryptic cleavage after Arg-15 results in a fully active enzyme (pi-chymotrypt delacety) and the comment. Tryptic cleavage after Arg-15 results in a fully active enzyme (pi-chymotrypt delacety) further chymotryptic cleavage liberates the dipeptide Thr-147 and Ag Asn-148 directly from chymotrypsinogen, which leads to the degraded form neochymotryps (S;Superfamily: trypsin: trypsin homology C;Superfamily: trypsin: trypsin homology C;Keyvords: hydrolase; pancreas; protein digestion; serine proteinase; zymogen F;1-245/Product: chymotrypsinogen #status experimental carm>F;1-13,16-146,149-245/Product: alpha-chymotrypsin #status experimental cMPT>

The invention relates to novel serine proteases designated BSSP5

(AAB11710-B11711), and to nucleic acids encoding them (AAA61733-A61744).

(The invention also relates to vectors and transformants comprising BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 nucleic and an mBSSP5 knockout mouse. The invention additionally encompasses anti-BSSP5 antibodies and methods of production of such artibodies, methods of BSSP5 detection using the antibodies, and the use of BSSP5 proteins or fragments as diagnostic markers for certain medical conditions or fragments as diagnostic markers for certain pancreatitis comprising measuring BSSP5 concentration in the blood or urine, and a pancreatitis diagnostic agent containing an anti-BSSP5 isolated in a human brain cDNA library using degenerate PCR primers (AAA61745) based on conserved regions of serine proteases. The BSSP5 serine proteases and nuclectides encoding them are useful in detecting homologues, mutants and polymorphic variants in biological samples (e.g., blood, urine, brain, prostate gland, placenta, testis, pancreas and spleen) as diagnostic markers for conditions such as Alzheimer's alsease, epilepsy, cancer, inflammation, infertility, pancreatits and prostatic hypertrophy. Sequence AAB11711 represents murine BSSP5 human brain and sequence AAB11711 represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to novel serine proteases designated BSSP5

(AAB1710-B11711), and to nucleic acids encoding them (AAA61733-A61734).

The invention also relates to vectors and transformants comprising BSSP5
nucleic acids; transgenic animals in which the expression level of BSSP5
nucleic acids; transgenic animals in which the expression level of BSSP5
can be varied; and an mBSSP5 knockout mouse. The invention additionally
encompasses anti-BSSP5 attibodies and methods of production of such
antibodies, methods of BSSP5 detection using the antibodies, and the
use of BSSP5 proteins or fragments as diagnostic markers for certain
medical conditions, e.g., pancreatitis. A method for detecting
medical conditions, e.g., pancreatitis and approach to a pancreatitis diagnostic agent containing an anti-BSSP5
urine, and a pancreatitis diagnostic agent containing an anti-BSSP5
antibody is also disclosed. Nucleotides encoding BSSP5 were initially
isolated in a human brain cDNA library using degenerate PCR primers
(AAA61745, based on conserved regions of serine proteases. The
BSSP5 serine proteases and nucleotides encoding them are useful in
detecting homologues, mutants and polymorphic variants in biological
samples (e.g., blood, urine, brain, prostate gland, placenta, testis,
pancreas and spleen) as diagnostic markers for conditions such as
Alzheimer's adseases, epilepsy, cancer, inflammation, infertility,
pancreatitis and prostatic hypertrophy. Sequence AAB11711 represents

proteins, called pancreatic cancer antigens, given in AAB54008 to
AAB5466. The human pancreatic cancer antigens have cytostatic,
neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive,
gynaecological, cardiant and antilifammatory activities, and can be used
in gene therapy. The polynucleotide and proteins can be used for
preventing, treating, or ameliorating a medical condition or in assays
for diagnosing a pathological condition or a susceptibility to one in a
subject. Binding partners to the proteins and the activity of the
proteins can be identified. The pancreatic cancer antigens can be used to
detect, treat or prevent pancreatic disorders, especially cancer.
Agonists and antagonists to the antigens can be used to design nucleic
and antagin probes that can be used in chromosome mapping, linkage
analysis, tissue identification and/or typing and a variety of forensic
and diagnostic methods. The proteins can be used to generate antibodies
which are used to purify, detect and target the polypeptides, including
both in vivo and in vitro diagnostic and therapeutic methods. The
proteins can be used to treat or prevent neural, immune system, muscular,
reproductive, gastrointestinal, pulmonary, cardiovascular, renal or
proteins as be used to treat or prevent neural, immune system, muscular,
reproductive, gastrointestinal, pulmonary, cardiovascular, renal or
proliferative disorders. AAC99232 to AAC99240 and AAB54467 represent
sequences used in the exemplification of the present invention.

```
The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes) central or peripheral nervous system diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, psychotic disorders, neurological disorders, hypotension, hypertension, psychotic disorders, neurological disorders, and dyskinesias.

(e.g. Alzheimer's disease, parkinson's disease) and dyskinesias.

(e.g. Alzheimer's disease, parkinson's disease) and dyskinesias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               infections such as ocular disease (e.g. glaucoma) and macular degeneration. AAU82702-AAU82760 represent the novel human proteases of

TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel extracellular serine protease, termed tumor antigen-derived gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a review of sequence homologies of several plasminogen activators. Plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Its active form, plasmin, is implicated in pericellular proteolysis associated with a wide range of physiological and pathological processes. Plasminogen expression is regulated by plasminogen activators which hydrolyse a peptide bond in plasminogen to convert it to plasmin or form tight binding complexes with plasminogen to spontaneously convert it to plasmin. The sequence homology analysis has identified a six amino acid peptide involved in plasminogen activation. This peptide is particularly useful when inserted between amino acid residues 644 and 645 of full length human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plasminogen. Novel plasminogen activators have been made based upon the plasminogen activation/recognition site of plasminogen binding proteins. The polypeptides are useful in preparing thrombolytic agents for treating blood clotting disorders such as heart attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polypeptide with plasminogen activator activity useful as thrombolytic agent for treating blood clot disorders e.g. heart attack, comprises 10 amino acid peptide fragment for recognition or activation of

The product is useful in rejuvenating the elasticity of the arterial wall, and improving unusual serum lipid levels and lipoprotein metabolism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving annititating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human amino acid sequences of the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      e: The sequence data for this patent did not appear in the printed scification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences.

This sequence represents human plasminogen. Fragments of this sequence can be used in the compounds of the invention. Kringle 5 (K5) peptide fragments homologous to this sequence, are anti-anglogenesis agents.

Can be used in the compounds of the invention. Kringle 5 (K5) peptide fragments homologous to this sequence, are anti-anglogenesis agents.

Can pecifically for treating or preventing psoriasis, arthritis, metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas.

They can also be used for treating or preventing psoriasis, arthritis, metular degeneration and diabetic retinopathy. The fragments can also be used to treat autoimmune or ocular diseases, capillary proliferation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenca. As antisers of (anti)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce anglogenesis, e.g. for wound healing. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for aflinity purification of K5 receptors. The K5 receptors may then be cypeased in tumour cells to increase their response to the peptides or used for identification of smallar antagonists. The Ab are used to used to content of smallar antagonists. The Ab are used to used to the peptides in biological samples. The K5 peptides (and K5 fision proteins) selectively inhibit proliferation of endothelial cells with low toxicity against towine capillary cells in colliferation of unbility against bovine capillary cells in colliferation and colliferation of co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New kringle 5 peptide(s) and fusion proteins derived from plasminogen - useful as anti-angiogenesis agents for treating cancer, psoriasis, arthritis etc., including gene therapy
                                                                                                                                                                                                                                                                                                                                                                                      Davidson DJ, Gubbins EJ, Wang J;
